A Novel Bonding Technique

(patent pending)

An unique trifunctional silyl-reagent was developed as shown in Fig. 1. This silyl-reagent can bond with any silanol groups on silica surface as shown in Fig.2 because it can expand and contract by itself. This technique can make residual silanol groups on C18 stationary phase to be the least amount.

Finally an end-capping was done with trimethylsilyl-reagent (TMS).

Features

- ★ Little residual silanol groups by an unique bonding technique
- ★ Excellent stability, especially under acidic pH conditions
- ★ Sharp peak shape for acidic, basic and chelating compounds
- ★ RP-AQUA is available under 100% aqueous conditions, and shows enhanced retention of polar compounds.

◆Evaluation of End-capping

Comparison of plates number (N) and USP tailing factor (TF) of amitriptyline

CH₃OH, pH7.5, 40 °C

Column size: 150 x 4.6 mm

Particle size: 5μm

Mobile phase:

CH₃OH/20mM Phosphate buffer pH7.5 or 6.0 =80/20

CH₃CN/20mM Phosphate buffer pH7.0 =60/40

Flow rate: 1.0 mL/min

Temperature: 40 °C or 22 °C

Sample: 1 = Uracil

2 = Propranolol

3 = Nortriptyline

4 = Amitriptyline

CH₃OH, pH6.0, 22 °C

CH₃CN, pH7.0, 40 °C

Amitriptyline is widely used to evaluate residual silanol groups on the C18 stationary phase. Peak shape of amitriptyline was compared under 3 kinds of conditions such as methanol/phosphate buffer/40 °C, methanol/phosphate buffer/22 °C and acetonitrile/phosphate buffer/40 °C. Under methanol/phosphate buffer/40 °C conditions which is the most common among HPLC manufacturers, good peak shape was obtained for all columns. There were little difference of a peak shape. Under acetonitrile/phosphate buffer/40 °C, however, Sunniest columns showed a symmetrical peak, while column A and B C18 showed a terribly tailing peak.

Sunniest C18, RP-AQUA and C8 columns allow to use a wide range of mobile phase without peak tailing because of extremely low content of residual silanol groups on the stationary phase.

Sample: 1 = Butylbenzene

Stability under acidic pH conditions was evaluated at 80 °C using acetonitrile/1% trifluoroacetic acid solution (10:90) as mobile phase. 100% aqueous mobile phase expels from the pore of packing materials by capillarity and packing materials doesn't deteriorate. 10% acetonitrile in a mobile phase allows an accurate evaluation.¹⁻³⁾

★ Sunniest C18 has kept 90% retention for 100 hours under such severe conditions.

Our bonding technique can make column life be long.

Sunniest RP-AQUA is less stable than Sunniest C18. However, Sunniest RP-AQUA has more stable than other company C18 columns.

Stability under basic pH conditions was evaluated at 50 °C using methanol/Sodium borate buffer pH 10 (30:70) as mobile phase. Sodium borate is used as a alkaline standard solution for pH meter, so that its buffer capacity is high.

Elevated temperature of 10 °C makes column life be one third. When Sunniest C18 column is used at 40 °C, column life becomes 2,000 hours. Other company shows stability test at ambient (room temperature). If room temperature is 25 °C, column life at room temperature (25 °C) is sixteen times longer than that at 50 °C.

★ Sunniest C18 is enough stable even if it is used under pH 10 condition. Regarding stability under basic pH condition, there is little C18 column like Sunniest C18 except for hybrid type C18. It is considered that our end-capping technique leads high stability.

★ Sunniest C18 can be used at the pH range from 1.5 to 10. Sunniest C8 can be used at the pH range from 1.5 to 9.

It is important that stability is evaluated under 100% aqueous conditions for an AUQA type C18 column because column life becomes longer to increase a content of organic solvent in a mobile phase. Sunniest RP-AQUA can be used under 100% aqueous conditions from pH2 to pH8.

★ Sunniest RP-AQUA can be used under 100% aqueous conditions from pH 2 to pH 8. Sunniest RP-AQUA is one of the most stable aqua type column.

◆ Reproducibility of retention under 100% aqueous conditions

★ C18 and C8 reversed phases exhibit decreased and poorly reproducible retention under more than 98% aqueous conditions as shown in Fig. 1. This problem traditionally has been explained as being the result of ligand collapse or a matting effect. Nagae¹⁻³ ascertained, however, that the mobile phase was being expelled from the pores of the packing material under 100% aqueous mobile phase conditions, as Fig. 2 shows.

★ When the surface of packing materials isn't wet by water, water used as a mobile phase expels from the pore of the packing material by capillarity. This is a reason why reproducibility in retention is low under 100% aqueous conditions. Reversely pressure around the packing material makes water permeate into the pore of the packing material to overcome a force worked by capillarity.

In other words, the surface of a reversed phase like C18 isn't wet by water anytime even if water permeates into the pore of the packing material or not. So it is wrong that we say "dewetting" when water expels from the pore. Saying "Depermetating" is more suitable.

★ Sunniest RP-AQUA is a reversed stationary phase, so that it is not wet with water. However the contact angle of water on the surface of Sunniest RP-AQUA is less than that of a conventional C18. Expelling force (pressure) acted by capillarity on Sunniest RP-AQUA is less than atmospheric pressure. So, Sunniest RP-AQUA shows reproducible retention under 100% aqueous conditions.
